

# Smart Contract and its Applications

MohamadAmin Sadeghi

(School of Electrical and Computer Engineering University of Tehran)

## Abstract:

A smart contract is a contract that is enforced automatically. Smart contracts are written as computer programs. These program identify in what situation what transaction must take place. Smart contracts can be enforced either by a centralized authority, or in a decentralized network, such as a distributed blockchain. I will first explain fundamentals of smart contract and then I will overview some practical examples.
